RR-2-JAB-MCB Revised, May 7, 1940

Program Analysis Report No. 2, Revised Planning and Control Section Rural Rehabilitation Division

REGIONAL AND STATE DISTRIBUTION OF THE NEED FOR RURAL REHABILITATION

The distribution among the several states of conditions of rural poverty shown in Column E, Table I, has been prepared as a crude index of the need for rural rehabilitation activities. The index gives the estimated number of farm families with annual net incomes of less than \$500 in each state and Region as a percentage of the total number of such families in the United States.

1/ U. S. Census of Agriculture, 1935. Figure includes only the families of farm operators.

Estimates were calculated and arranged from Study of Consumer Purchases released by Bureau of Home Economics, USDA, based on 1935-36 surveys and U. S. Census of Agriculture, 1930. Both non-relief and relief (regardless of income) farm families are included. Tentative, subject to change on receipt of more nearly adequate data.

3/ Rhode Island -- 400 families.

4/ .02 percent.

This index for each Region was calculated by combining the information on farm population in the 1935 Census of Agriculture with that from the preliminary releases of the Study of Consumer Purchases by the Bureau of Home Economics, U. S. Department of Agriculture. (See Program Analysis Report No. 1, Revised)

Having thus obtained for each Region the estimated number of farm families with annual incomes of less than \$500, this number of farm families was allocated to each of the states composing the Region. Ratios of net to gross income were derived for each state from the random sample of year before acceptance data as given in the Report of the Family Progress of Standard RR Borrowers, 1939. On the basis of these ratios, data from the 1930 Census of Agriculture on the relative number of farm families in each state in given levels of gross income were used to apportion the Regional number of lowincome farm families to each state. It should be pointed out that this method

 of estimation assumes that the relative distribution of farm population by gross income levels is the same, in general, as in 1930 within each state. Various income studies by the Bureau of Agricultural Economics and by the State Agricultural Experiment Stations appear to indicate that this assumption is valid, when applied within Regions, although such a process would be grossly inaccurate when applied to states widely separated geographically.

The number of farm families in each Region and state is given in Column B. This number was multiplied by the percentage in Column D, thus giving for each Region and state the estimated number of farm families whose annual net incomes were less than \$500.

The figures shown in Table I should be interpreted in light of the following conditions. The figures used for the number of farm families as well as the income data refer to 1935. There have undoubtedly been some changes in respect to both conditions. Although population increases have not been uniform from Region to Region, it did not seem advisable to attempt to estimate the net effects of this differential rate of population growth.

The figures shown in Column C include all farm families on relief as well as the non-relief farm families whose annual net incomes were less than \$500. It should be pointed out that these figures refer to the families of farm operators only; they do not include farm laborers, whether resident or migratory, nor non-farm families who reside in rural areas, but they do include sharecroppers in the Southern States.

The figure of \$500 annual net income was chosen for two reasons: (1) this figure forms the dividing point between the lower one-fourth and the upper three-fourths of the farm families of the nation from the standpoint of income; (2) since the class intervals used in the Consumer Purchases Study were necessarily followed, it was felt that \$500 was a more significant figure for the present purpose than \$250 or \$750.
